ON THE HYDROMEDUSAE FROM THE SHANTUNG COAST

by

Kao Cheh-Sheng, Li Fung-Iai, Chang Ün-Mei, Li Hien-Lun

(Biology Department of Shantung University)

Most of the Hydromedusae or veiled medusae are the sexual generation of the Hydroids. In an earlier paper, one of the writers, Kao Cheh-Sheng (Kao, 1956), has given the descriptions of 30 species on the Hydroids from the coast of Shantung. The present paper records 33 species of Hydromedusae.

Materials used in this study were collected from the coast of Shantung during 1950-1957, most of which were obtained from Tsingtao, and some from Chefoo and Weihai (north-east of Tsingtao).

Of the 33 species examined some are also found in other places of China, and twenty-seven are here recorded for the first time as occurring in China. The 33 species belong to 26 genera in 16 families, of which one species and two varieties being new to science. Specific descriptions and figures have been given for each species. The species studied and dates of collection are included in the following list:

Order Anthomedusae

Family Corynidae

1. *Sarsia nipponica* Uchida: Tsingtao; April 11, 1957.

Family Tubulariidae

2. *Ectoplaura dumortieri* L. Agassiz: Tsingtao; June 21, 1956.
3. *Hybocodon octopleurus* n. sp. with description.
4. *Euphyes bigelowi* (Mans): Tsingtao; June 10, 1956.

Family Cladonemidae

5. *Cladonema mayeri* Perkins: Chefoo; July 19, 1956.

Family Clavidae

6. *Turritopsis nutricula* McCrady: Tsingtao; August 1955.

Family Bougainvilliidae

7. *Bougainvillia autumnalis* Hartlaub: Tsingtao, Chefoo; June 1956.

Family Pandeidae

8. *Amphinema dinema* L. Agassiz: Tsingtao; November 18, 1956.

9. *Amphinema rugosa* var. *Tsingtauensis* n. var. with description.

10. *Turris vesicaria* A. Agassiz: Tsingtao; July 1, 1956.

Order Leptomedusae

Family Campanulariidae

11. *Obelia dichotoma* Hincks: Tsingtao, Chefoo; September 1955.

12. *Clytia folleata* (McCrady): Tsingtao; June 25, 1956.

13. *Phialidium discoidum* Bigelow: Tsingtao; June 30, 1956.

14. *Phialidium hemisphaericum* Mayer: Tsingtao; June 30, 1956.

15. *Phialidium virens* Maas: Tsingtao, Chefoo; June 1956.

16. *Gastroblasta chengshanensis* Ling: Tsingtao; June 25, 1954; Chefoo, July 11, 1959.

Family Eirenidae

17. *Phortis Pyramidalis* Mayer: Tsingtao; July 1, 1951.

18. *Phortis kambara* (Agassiz & Mayer): Tsingtao; September 10, 1957.

19. *Phortis lactea* var. *Chiaochowensis* n. var. with descriptions, 1956.

20. *Helgicirrha malayensis* Stiasny Tsingtao; all year may be collected.

Family Lovenellidae

21. *Eucheilota ventricularis* McCrady: Tsingtao; September 23, 1956.

Family Aequoreidae

22. *Aequorea coerulescens* Brandt: Tsingtao; February-April 1955.

23. *Aequorea conica* Browne: Tsingtao; October 15, 1956.

Family Eutimidae

24. *Octorchis gegenbauri* Haeckel: Tsingtao; September 14, 1956.

25. *Tima formosa* L. Agassiz: Tsingtao; May to July, 1956.

Order Linnomedusae

Family Proboscidaetyliidae

26. *Proboscidaetyla flavicirrata* Brandt: Tsingtao, Chefoo; July 1956.

27. *Proboscidaetyla ornata* var. *gemmifera* Mayer: Tsingtao; September 27, 1955.

28. *Willisia mutabilis* Browne: Chefoo; July 25, 1956.

Family Moerisiidae

29. *Moerisia Lyonsi* Boulenger: Weihai; July 25, 1956.

Family Olindiidae

30. *Gonionemus murbachii* var. *Chekiangensis* Ling: Chefoo; July 13, 1956.

31. *Gonionemus murbachii* var. *oshoro* Uchida: July 13, 1956.

Order Trachymedusae

Family Geryonidae

32. *Liriope tetraphylla* (Chamisso et Eysenhardt) Tsingtao; November 15, 1956.

Order Siphonophora

Family Diphyidae

33. *Diphyopsis chamissonis* (Huxley): Tsingtao; November 15, 1956.

Descriptions of New Species

Hybocodon octopleurus n. sp.

(Plate I. fig. 3)

Umbrella bell shaped, nearly spherical; without apical process; with umbrella margin at oblique angle. Jelly thick. Exumbrella with eight meridional nematocyst tracks. Four radial canals and ring canal fairly broad; radial canal on tentacular side longer than that opposite it. Stomach large, cylindrical, about two-thirds the side length of umbrella cavity, never reaching beyond margin in full extension. Mouth simple and tube-like, armed with nematocysts. Velum moderately broad. The largest marginal tentacle with the terminal end enlarged, and a row of much nematocyst batteries along the inner side. The remaining three non-tentacular marginal bulbs greatly reduced to mere endodermal swellings. Gonads completely surrounding stomach, leaving peduncle and mouth free. Height 1.7 mm. Colour: mouth, and tentacular bulb yellowish; stomach greenish.

The present species differs from *Hybocodon prolifer* L. Agassiz in the presence in exumbrella of eight meridional nematocyst tracks instead of five, the largest marginal tentacle with much nematocyst batteries arranged in a row along the inner side.

Locality and date.—Three specimens were collected from the Chefoo harbour, July 11, 1956.

Amphinema rugosa var. *tsingtaensis* n. var.

(plate IV, fig. 1)

Umbrella bell shaped, with large hemispherical apical process. Jelly moderately thick, side of umbrella nearly straight. Two opposite perradial marginal tentacles, very extensile, with large hollow, elongated, conical basal bulbs. Twenty small marginal warts with prominent ocelli on their abaxial-side. Stomach cross-like in section, flask shaped, half the length of umbrella cavity, never reaching umbrella margin. Mouth cruciform with four recurved crenulated lips. Four radial canals and ring canal broad, with slightly jagged outline. Gonads forming three or four folds sloping obliquely downwards towards the interradii on each of the eight adradial surface of the stomach. Height 4-7.5 mm. Diameter 5-10.5 mm. Marginal tentacle bulbs and stomach brownish yellow to orange.

This new variety differs from its type species *Stomatoca rugosa* by having prominent ocelli on the abaxial-side of the tentacle bulbs and warts. The marginal warts very small, not elongated tentaculæ.

Locality and date.—Numerous specimens were collected in the coast of Tsingtao, November 27, 1956.

Phortis lactea var. *chiaochowensis* n. var.

(Plate VI, fig. 1)

Umbrella hemispherical; Jelly in upper portion of umbrella very thick, thin at side of umbrella. Sixteen marginal tentacles with large conical base, each with a group of dark pigments on their abaxial-side, neither lateral nor marginal cirri. Closed marginal vesicles up to sixty or more in number, each with three to four concretions. Stomach short, situated on conical peduncle, never extending beyond umbrella margin. Mouth with four long pointed perradial lips with crenulated margins. Four straight radial canals, and ring canal narrow. Gonads on radial canals, sinuous, usually limited to disk of subumbrella, not extending on the peduncle reaching from near base of peduncle almost to ring canal. Height 8mm. Diameter 12mm. Colourless, except for black pigments on base of marginal tentacles.

This new variety differs from its type species *Phortis lactea* by having dense black pigments on the abaxial-side of the tentacle bulbs; less number of marginal tentacles. Stomach situated on short, large conical peduncle.

Locality and date.—Two specimens were collected from the coast of Tsingtao, June 15, 1956.
