*Paralongicyatholaimus minutus* Warwick, 1971  
(Fig. 131)

**Description.** Body length 0.7–0.8 mm. Maximum diameter 21–27 µm (a = 27–38). Cuticle with transverse rows of small dots. Four shorter 2–2.5 µm and six longer 3–4 µm (0.4–0.6 h.d.) cephalic setae. Buccal cavity cup-shaped; teeth absent. Amphids of about 4.5 turns, 5 µm (0.5 c.d.). Oesophagus 87–92 µm long, terminating in a rounded bulb 15–18 µm long and 11–14 µm wide. Tail 230–260 µm (13–13.5 a.b.d.), filiform.

Spicules 29–32 µm (1.6 a.b.d.) measured as a curve, arcuate, slightly cephalate proximally. Gubernaculum 14–17 µm, pointed at both ends with a subterminal distal swelling. Supplements absent.

**Distribution.** Northumberland coast, North East England (sublittoral fine sand).
