

*Anticoma stekhoveni* Mawson 1956, nec. Wieser 1953.

A re-examination of the type material of this species has shown that the excretory pore is at the level of the amphids. The species therefore belongs in the group including *A. acuminata*, *A. similis*, *A. subsimilis* and others. It appears to be distinguishable from these by the forward position of the amphids and cephalic setae.
