

Paralinhomoeus ampullocaudatus n. sp.

Fig. 229 a, b

Locality and material. — South Georgia, St. 34: 1 juv.

Dimensions: L = 3,0 mm., $\alpha = 40,0$, $\beta = 9,65$, $\gamma = 15,31$.

Body in its total length absolutely evenly thick and on the whole strongly thinned. Cuticle smooth? Head truncate. Cephalic bristles not found. Lateral organs immediately behind the buccal cavity, rounded, thick-walled, very large, measuring in section $16,4 \mu$, i. e. exactly half the corresponding head diameter; thickness of its wall 3μ . Oesophagus short, posteriorly bulb-like swollen.

Tail remarkably short, $3 \times$ the anal body diameter, first gradually conically narrowed, then in a short distance thin, at the end distinctly and rather strongly swollen.

St. 34. South Georgia. Off the mouth of the Cumberland-Bay. $54^{\circ} 11' S.$ — $36^{\circ} 18' W.$ Grey clay with a few stones. 250—310 m. Bottom temp. + 1,45 C. 5. 6. 1902.

Number of species found: 38; Number of specimens found: 224.
