

If *S. communis* really is the male of *S. tenuicaudata* of which both BASTIAN and DE MAN (1907) have described only females, then it is impossible to include in the same species the specimens classified as *S. tenuicaudata* by STEKHOVEN (1943). The latter have much more in common with *S. cupida* to which species they, accordingly, will be referred. Even then, *S. tenuicaudata* remains doubtful.
