

***Siphonolaimus falklandiae* n. sp.**

Fig. 92 a—c

Locality and material. — Falkland Islands, Port Louis, Greenpatch: St. 42a, 2 ♂♂  
Two exceedingly strongly wounded males were present in the sample from Greenpatch.

Body of about even thickness in its total length. Cuticle thick and smooth. Head with submedian bristles, obliquely-truncate. Buccal cavity small and the "spear" in every respect typical of this genus. Lateral organs immediately behind the buccal cavity and rather large, circular. Ventral gland pore in a distance behind the spear equal to the distance front end—spear. Tail short, clumsy, cylindrical, posteriorly truncate, about as long as the anal body diameter. Spicules slender, curved. Accessory piece with a dorsally directed apophysis.

Unfortunately it was not possible to measure the strongly wounded animals.

St. 42a. Falkland Islands. Port Louis; Greenpatch. Material shaken up from algae and kelp-rhizoids, cast up on shore by storm. 30. 7. 1902.

Number of species found: 54; Number of specimens found: 150.
